* Send keystrokes to the mouse automatically * Works with mouse and keyboard (works with USB mice and keyboards) * Customizable macro of keystrokes (all combinations) * Translate mouse and keyboard commands to keyboard macro KeyMacro Lite is a small, easy-to-install and efficient utility that acts as a helper program for most Windows users. It makes use of the WinAPI to accomplish many tasks, ranging from simple copy-paste functions to automated text processing. It can be controlled with a simple and intuitive GUI, and can be extended to perform more complex tasks with very little effort. KeyMacro features: * Advanced menu control with context menus and support for multiple items * Allows multiple items to be selected at once * Can copy, move, paste or delete multiple files or folders at once * Automatically performs file renaming, renaming directories and creating shortcuts when necessary KeyMacro can be accessed from the Windows start menu, from the command prompt or within any other Windows app. It can even be controlled from a third-party tool, such as a media player or a game. KeyMacro is a powerful application that can do anything that an advanced user or a technician might need. It is simple to install and use, and can be modified to suit the user's exact needs. Note that KeyMacro Lite is available separately. This is a full-featured version of the program that supports all its features, including customizable macros. KeyMacro Lite is highly configurable, and is fully compatible with all features found in the paid version of KeyMacro. In fact, KeyMacro Lite will be upgraded to the next major release of KeyMacro when the time comes. KeyMacro Lite is free software that can be run on most computers. While it is completely compatible with all features found in the paid version, it does not offer any extra features, and cannot be used to upgrade to the next major release. Keyboard Software - Korean Keyboard Layout 1.0 Korean Keyboard Layout is a special software program. Once installed, you'll be able to turn the ordinary US keyboard layout into a Korean keyboard layout. At the same time, you can also convert the ordinary Korean keyboard layout into... 20.99 KB Keyboard Software - ABC key to type numerals 0-9 in Notepad++ ABC key to type numerals 0-9 in Notepad 45cee15e9a

qemu executes the commands provided in a string of keystrokes, and when the command sequence is entered, it pauses for a while and resets the console. For more details: The keymacro extension enables you to define macros in QEMU, these are basically the same as qemu's -keyb options but with macro support. As such they can be used to set the keyboard layout of the guest. The keymacro function is passed a string consisting of keystrokes (usually a sequence of keys), and a string containing the expected response (usually a pause). The macro may also return another string (containing a modified response). This should be used carefully though, as it may be used to run commands on the host machine (from the guest) or alter the command provided to the guest (eg if the macro only accepts a basic sequence of keystrokes and not an extended keyboard layout). Keymacro examples: keymacro '^[[ENTER]]' 'vncserver' '-geometry 640x480' keymacro '^[[ENTER]]' 'vncserver' '-geometry 320x240' Note that the string "ENTER" may be replaced by any string that is the end of a command sequence. More Examples: # Display the virtual machine's hostname # hostname:
