Q: How does a function like strcmp() know if it is comparing strings or pointers? I'm looking at a lot of C source code that uses strcmp() in a lot of cases. strcmp() is supposed to compare two strings, and it's not always clear whether it's comparing to two strings or a string and a pointer. How does strcmp() know that it's comparing two strings and not two pointers? How do different compilers handle this? A: The C Standard says: When the type of the second operand is a qualified or unqualified pointer type, the first operand is evaluated and the result is a pointer to its beginning. The address of the result is converted to an int, and the value of that many bytes from the start of the first oper
