Subscribe to the Chiptunes=Art newsletter! Subscribing to the newsletter will not only let you to keep up with the development of the software but will also help the developers to get in touch with the community. Thanks for reading my first article here on Nch. I'm sure that this will be the start of a great journey together and I appreciate your support!

It was like any other morning at the Rural Water Desk in Southwestern Ontario. "Good morning, Mr. Farmer," said Marie MacDonald, director of the office, to a man who had made an appointment to renew his farm sprinkler zone subscription. She'd worked at the Region of Peel office for nine years, after graduating from Durham College with an engineering degree. She tried for an office job in Lake Ontario, but had to shift to the nearest branch office to keep her family in country life. Then, in September of 2014, MacDonald, a French Canadian with a strong rural background, watched as dozens of local farmers in her part of the province were told their water meters had expired or would be replaced by July 2, 2015. Story continues below advertisement The cut-off was in the middle of a very dry summer and there were no water

restrictions. Still, the 9,000 farmers in the Peel region did not receive a notice from the Region of Peel; instead, they received it from a local member of Parliament. "I'm like, 'Well, where's my water?' Everyone's saying, 'The water's cut off and you've got to bring it in,'" MacDonald recalled. "We found out later there was a problem with our mail system." The Region of Peel confirmed on Thursday that more than half of Ontario's water system customers are receiving late bills and water cutoff notices, while most of those who receive a water cutoff notice have not been billed. The situation is similar in Quebec, where a number of Quebec, North Shore and Outaouais water districts have been experiencing uncollected or late invoices. The Ontario and Quebec governments, as well as the United States Environment Protection Agency, have acknowledged that a failure of a key automated meter-reading device at more than half of the province's water and wastewater facilities has led to errors and transmission problems. The problem has been in place for about five years. As a result, the two governments are considering a number of possible solutions, including

A pixel art environment builder! The main features of Rectitude: - Easy to use and learn, and fast to create complex scenes. - A minimum of requirements, so any computer can run it, no matter what operating system it is. - Can generate flat 2D images, or 3D models, whatever you want! - Very powerful, with lots of nodes and great content! How to use Rectitude: First, you need to create a project in the application: press the new icon on the main menu and choose 'New Project'. Next, choose a theme (which is an image that will be used to represent your image data in the scene). Double-click on one of the wallpapers that is provided with the app, or select one yourself and use it to write the scene's name. Name the scene, and save it to your computer. Next, click on the other graphics file provided with the app, one of the pre-made sprites or one of the pre-made block forts and resize them according to the rules of the scene. Place them in the desired spot in the grid, using orthographic as your view mode (this means all objects stay in their own spots on the grid, without any interpolation). Go back to the main menu and click on the one with the word 'Nodes'. This will display all the available nodes for the selected tool. First, choose the colorization node, and go to the left bar. Select the

colorize node, and use its slider to colorize the object. Next, choose the reclassification node, and click on the button with the right arrow. Select the reclassify node, click on the value node, then use the slider to change the node's properties, so that you can control the properties for the specific node you want to edit. For example, you can edit the colorize or reclassify node or you can choose to change the node's properties on its own axis. These are some of the basic nodes that Rectitude can use, but you can always create new ones as well. Now, create a collection or a collection of collections (depending on the way you want to display your objects), and place them inside the selected node. Each node is a collection of elements. Each element can be a block or a sprite, which are basically pre-made graphic components that users can use to create

Features: Creates content-rich environments through the use of procedural generation. Automatically generate 3D or 2D objects. Use pre-built content to cut down the time of experimentation. Possesses diverse nodes to create your custom content. Accepts audio, 2D, and 3D inputs. Allows for exporting content in ZIP or OBJ files.

Procedurally Generates: To be precise, Rectitude can generate in the following categories: 1D - Generates the desired width and height of the generated image. 2D - Generates the color, material, and size of the generated image as well as the rotation and scaling in any given direction. 3D - Generates the color, material, size, rotation and scaling of the generated image. Controllers: The final result of the process is represented by the Graph, a la the underlying principles of a game.

Controls: The Start node will load your main.png or.obj file. If the player selects the img node, they are allowed to load a.png file. If the player selects the obj node, they are allowed to load the.obj file. The Output node would generate a file with the file extension on the directory of the parent folder. By changing the mode from file to 3D, the user is taken to a custom function where they can

either test the 3D creation, move on and create a 2D object, or create a 3D object. The different types of nodes: We have 3 types of nodes that make up the graph. Image Nodes: Image node is the base of Rectitude. Every image node can generate a block (Part) of pixels. If the player presses the create node, a preview window will appear which allows them to insert the value of the generate node by typing in a number and pressing enter. When the value is generated, you can move and draw the block of pixels in your file. Block Nodes: A block node creates blocks of pixels or pixels. If the user presses the create node, a preview window will appear and allows them to insert the value of the generate node. When the generate node is pressed, the player is allowed to move and draw the block of pixels in their file. Value Nodes: The

What's New in the Rectitude?

Rectitude is a pixel art editor and procedural generator for Windows. It offers its users a graphical interface to build their own pixel art (in a 3D space of course) from a series of building blocks such as bsp, tiles, etc. A procedural generation approach allows them to quickly

learn to design pixel art without any tools such as tutorials or pre-built assets. Instructions: There are no instructions with this demo version. Installing: There's no need for any sort of software activation. The only thing that's needed is the installation of the proper version of the DLL that corresponds to the currently active branch (version 0.2 or 0.3). The compilation of the application is straight forward. Version 0.2: Here's the full compilation instructions for the Rectitude 0.2 beta application. You should be familiar with the install process in any case; just make sure you have the latest version of the DLL on your hard drive. 2. Expand the Rectitude.exe package and copy the content of the "output" folder to the path you specified. 3. Confirm the settings in the project window's settings and build the project. 4. The resulting EXE should be located in the "output" folder in your computer. You can then execute it to start the application. Version 0.3: We've updated the runtime installation process to make it simpler and more automated (we did add a "wizard" though). In order for this version of the runtime to work on Windows 7, you'll need to install an optional feature provided by the Square Enix® Visual Memory System (VMS) platform, otherwise you won't be able to properly edit your

backgrounds. This component of the installation process won't work with all visual memory systems, however it's working fine with Windows Vista, Windows XP, Windows 7, Windows 8, Windows 8.1, Windows 10, and Windows Server 2012. In order to install the VMS component, you need to update the AVE version which is integrated into the current version of the rectitude.exe installer. Now, you have no more to do than uninstall the AVE component from the previous version of rectitude and install the new one. Installing the VMS component is automatic and managed by the rectitude installer. Here is a screenshot of the AVE version installer: The "Settings" tab is where you can add your VMS

System Requirements For Rectitude:

Please install the game client before installing the launcher as the launcher is dependent on the game client. We highly recommend a minimum of a NVIDIA GTX 550 or greater for a smooth experience. Please do not install the game if your graphics card is lower than that. The game will run on the ATI Radeon HD series graphics card and above. For the minimum requirements see: For any additional information about server requirements, please see the Mineplex Server Beta webpage. Warnings: - Do
