Akt is an oncogenic signaling protein that plays a key role in regulating apoptosis and proliferation in response to cellular signals. Akt1 is one of three Akt isoforms, all of which are activated by phosphorylation at threonine 308 by phosphoinositide-3 kinase. Here we show that Akt1 has a strong intrinsic kinase activity in vitro that can be activated up to 50-fold by proteolytic cleavage by caspases and by a pro-apoptotic protein, APAF-1. APAF-1 cleaves Akt1 and all other Akt isoforms equally well, whereas caspases cleave Akt1 and Akt2 selectively. Co-expression of Akt1 with APAF-1 increases the sensitivity of Akt1 to cleavage and induces cell death. In case you are unable to launch it, then adding the path to the executable file could solve the problem. The interface of the application is very plain and simple to navigate through. You can get started by accessing the function that enables you to import pictures. Unfortunately, the application does not support drag and drop, an option that can save you considerable time and energy.
