A transition is now underway that is likely to transform the way many more people will be using CAD/CAM programs in the future. Not only is the PC replacing the mainframe, but the desktop PC has arrived in the majority of small to medium sized businesses (SMBs) and in the home. AutoCAD is now the accepted standard of CAD, at least among professionals. The Introduction of the Workstation When Autodesk introduced AutoCAD in 1982, it was the first CAD program to be widely adopted by the CAD user. It was supported by a sophisticated and stable development environment based on Lattice-C and the accompanying Lattice C compiler, along with an outstanding graphic user interface (GUI). The program could be easily integrated into the user's existing office computing environment (in particular an IBM compatible PC and DOS). Its adoption was aided by the design of AutoCAD being optimized to work on DOS and IBM PC compatible PCs. Today, this approach is the basis of many professional CAD solutions. A key feature of the introduction of AutoCAD as a Windows application was that it also brought the CAD function to the desktop. The PC was, and still is, at the center of the CAD function. The latest AutoCAD release features a new icon in the taskbar with the ability to open CAD drawings and modeling, even when no AutoCAD program is running. This icon also has the ability to call up the Help menu, or open the Autodesk.com web site. The creation of a native Windows application allowed many more people to use CAD software. The Advanced CAD market has become smaller With the introduction of Windows and the acceptance of the PC as a workstation, CAD programs spread to other types of computer systems such as minicomputers, mainframes, and mainframe-based CAD. Many of the more successful CAD programs and companies developed successful native applications for Windows, using the Windows API (Application Programming Interface). AutoCAD: The software of choice in the advanced CAD market By the early 1990s, with the widespread acceptance of Windows, and increasing numbers of PC-based systems replacing mainframes and minicomputers, the Advanced CAD market began to shrink. Companies with strong support from their Windows-based business partners chose to use their native Windows applications rather than the slower native Macintosh or DOS applications. Some of the companies formed CAD alliances to speed their growth. Others, such as Autodesk, responded
