Prior to the commercial release of AutoCAD, the first public version of the application was

called Pre-Draft, which ran on an Apple IIe in 1985. It was developed by AVI (All-Video Image) and was a cross between a program called System III and a screen-shifting screen magnifier app called Magnifier+. System III allowed users to create 3D models of buildings and other objects using a computer mouse instead of a graphics tablet. Its predecessor, Pre-Draft, was

described as a "graphics editor and viewer" and was designed to be a lightweight screen-shifting program. History In 1977, a startup company named AVI (short for Automatic Video Imaging) was formed in Palo Alto, California. The company's founders included Michael I. Gromada and Larry Smarr, who are often considered to be the fathers of virtual reality. AVI eventually became famous for

its work on the Brain project (also known as the "Spaceship" project). In 1981, AVI won a Defense Advanced Research Projects Agency (DARPA) contract to work on "Cardboard, the Virtual Reality Helmet". The focus of the project was to develop head-mounted display (HMD) technology to be used by U.S. military pilots for flight simulation training and other purposes. In 1982, the company

successfully demonstrated the first HMD prototype, known as the "Cardboard" headset.

However, after a few years of development, the project was terminated. Meanwhile, AVI used the prize money from its DARPA contract to fund development of a smaller HMD prototype called the "Blindsight" headset. This was a prototype design that simulated a large, curved, panoramic display

surface. The idea behind this concept was to display a virtual image in a highly curved environment. Blindsight was released in 1987 as a consumer-level video game console called "Phantom". The idea of using a HMD to simulate a 360-degree display came about when Gromada and Smarr first saw a picture of the Chinese room thought experiment of the philosopher John Searle.

According to Searle's thought experiment, no matter how much sense-data a person is exposed to, they will not be able to understand the physical world of objects. From this thought experiment, Gromada and Smarr came to believe that there is a fundamental limit to the amount of information that can be presented
