New Elements: Metalloids are chemicals that contain metallic elements (i.e., metals) bonded to nonmetals (i.e., elements other than metal). This can lead to new chemical structures, properties, and a myriad of potential applications.

New Elements: Palladium – Known as a noble metal, palladium can be used as a catalyst and in electronics. It also undergoes a lot of natural transformations and is used in jewelry, furniture, and electronic components.

New Elements: Isotopes -

Isotopes are an example of a natural element that has a very similar appearance to a different isotope of a very different element. This is because they are made of the same element, but they differ in the number of neutrons in the nucleus. New Elements: Magnesium, like calcium, is a metal that can be combined with different atoms to form an infinite number of different compounds.

Magnesium can be found in a variety of sources, including rock, water, soil, and air. It is the 3rd most abundant element in the earth's crust and is used in a wide range of everyday materials. New Elements: Lead, like silver, is a metal that is both inert and slightly malleable. It is a component of most metals and many alloys and can also be found in ores. It has been used to make electrical components, including batteries, since the 19th century. New Elements: Manganese is a metal that is used in catalysis, ceramics, and alloys. It is used in steel and has uses in human medicine and biochemistry.
