Photoshop Elements: We recommend making this your default tool for editing raster images. We also strongly believe that all new users should master the basics of Photoshop and use Photoshop Elements before being allowed to use Photoshop. Limitations of Photoshop Although Photoshop is the standard for raster image editing, it has its limitations. Most important is that Photoshop is not the best tool to edit vector graphics. Although Photoshop is capable of creating or editing vector graphics, Adobe has not created any tools or plug-ins to accomplish this task. If you're looking to create a vector-based file from scratch, you should consider using Adobe Illustrator. (We cover Illustrator in Chapter 12.) Also, Photoshop is not that great at the following tasks: Editing images: Photoshop's limit on layers works well in most cases, but sometimes you need to use more than one layer for a specific part of an image. For example, you can create a mask layer by using the Eraser tool to remove a specific portion of an image. But with Photoshop's limited number of layers, you must create multiple layers to accomplish this task. Editing text: Not all raster images can be edited with text, which is the universal method of editing in Adobe programs. You can create a text layer, or add text to an existing layer, but you can't edit text in a text layer. Also, you cannot manipulate text in any way. Drawing paths and lines: Photoshop is great at drawing paths and lines, but there are no tools available to edit these paths. You can't change the line width, color, or curve. Creating objects: Just as you can't change the color of a text layer or draw paths in Photoshop, you can't change the color or shape of a layer. You can create objects on a background, but you don't have any tools to edit those objects. Managing Layers As we note earlier in this chapter, Photoshop has a number of tools and features for creating and managing layers, including the following: Creating new layers: The Import dialog enables you to create a new layer. Controlling layer blending modes: By default, layers are either added to an image or positioned above it. If you want to apply a layer to a background, you must create a composite layer. With a composite layer, you can position the layer over the background, change its blending mode, or do anything you can do with a normal layer, except

Not in this shot but I used it in the previous shot. Try going back and forth between the two shots. Study the vignetting. It's also obvious where the centre of the image is. The harder you force in post processing the more it will look unnatural. Alright, I got it. I was just looking at how the paner applied black, but I see how that messed up the lens flare. What is a good lens to shoot the sun with? I know I can do a complicated bounce setup with a big softbox and diffuse, but that would be a pain to set up. I need something cheap and easy. What is the best way to remove the pitch blackness in a cloud shot? Assuming I'm using HSL instead of L, I've been using the options for chroma and saturation in Gimp. But I think there must be a simpler way. It's fine if it isn't perfect, because I know I'm still doing it wrong. Just some colors thrown in don't look right. Alright, I got it. Not to mention when you nail a cloud and the entire area is completely black it looks weird. I'd stay away from using extreme saturation. Thanks for the help. My first guess is to try to see if I can clone the image and lower the saturation a little so the black isn't so black. Anyway, I'm new to this camera and this is my first roll of film. It was my first time shooting this camera, and it was pretty fun. I'll have more later when I go to my friend's birthday party.Q: I can't install ffmpeg 0.5.1 on Ubuntu
